Optimizing remedial systems - one site at a time.
SINCE 1990

REDUX TECHNOLOGY® facts

Problem:

Fouling of Groundwater Treatment Equipment

Solution:

Effectively solving any fouling problem begins with good characterization of the nature of the fouling. Most deposits found in remedial systems are microbial, iron related, hardness based or a combination of these factors. Redux can analyze deposit and water samples, review operations history and develop a cost justifiable deposit control program. Redux has developed over thirty deposit control chemical formulations, the only chemicals designed specifically to control fouling in groundwater remediation applications.
